

ManthanOS — Early Tester Guide

Goal: validate whether ManthanOS helps reduce continuity friction across AI-assisted engineering workflows.

1. Prerequisites

- Node.js v20+
- pnpm installed
- Claude Code CLI installed and working
- Git installed

2. Install Test

- Clone the GitHub repo
- Run the README install commands exactly
- Verify that ``manthan --version`` works
- Report any install friction or dependency problems

3. Workspace Init Test

- Create a fresh test folder
- Run ``git init``
- Run ``manthan init``
- Verify ``.manthan/`` is created successfully

4. First Plan Test

- Run: ``manthan plan "Add OAuth login with Google"``
- Observe the generated plan
- Check whether the review hint is understandable

5. Brain Review / Promotion Test

- Run ``manthan brain review``
- Promote 2–3 facts using the provided syntax
- Report whether the workflow felt understandable

6. Second Plan / Continuity Test

- Run: ``manthan plan "Implement OAuth session refresh" --show-trusted``
- Check whether promoted facts appear
- Check whether the second plan reuses earlier decisions

- Identify the exact moment continuity became visible

7. Multi-Tool Workflow Feedback

- Would this help when using ChatGPT + Claude + Gemini/Codex together?
- Does the workflow reduce context repetition?
- Would you realistically use this on a real project?

8. What Counts as Success

- The second plan clearly reuses earlier project decisions
- The workflow feels understandable
- The tester sees value in continuity persistence

9. What Counts as Failure

- Install friction blocks usage
- The continuity loop feels unclear
- The second plan behaves like a fresh unrelated session
- The tester would not use it again

10. Feedback Template

```
OS:
Node version:
pnpm version:
Claude CLI version:

Install worked? yes/no
Init worked? yes/no
First plan worked? yes/no
Brain review worked? yes/no
Second plan reused promoted facts? yes/no

Biggest confusion:
Biggest useful moment:
Would you use this again? yes/no

Exact quote or line where continuity became visible:
```

Important: focus on real workflow usefulness, not architecture or future vision.
